## **MediaWall® 4200, MediaWall® 4500 and SuperView® 5000 Firmware Version 3.1.1 Customer Release Notes April 2011**

The Web Control Panel (WCP) virtual screen will now reflect changes to window positions instituted through serial commands and external control devices such as the BP-16 or a Preset Recall.

A new **Firmware Upgrade Assistant** is installed with firmware version 3.1.1, accessed through the WCP launch page. First, download the Firmware Update from RGB.com's Support Page for the product model. Launch the Upgrade Assistant. After entering the IP address of the *MediaWall* to be upgraded, the user browses to the location on the firmware. When **Upgrade** is selected, the assistant automatically:

- Exports system settings.
- Copies system settings to the PC.
- Upgrades Firmware.
- Copies system settings from the PC back to the *MediaWall*.
- Confirms Successful upgrade

### Bug Fix:

- *KvM WCP* now remembers IP Addresses between sessions.
- Improved network support for BP-16
