The *Zio*® Browser-Based Control Interface

One Interface for Configuration, Management, and Control

The *Zio* web-native Graphical User Interface (GUI) delivers centralized control of the entire *Zio* ecosystem through a single, easy-to-use interface. Designed for ease of use and operational efficiency, it enables full configuration, management, and control of all *Zio* devices from a single interface — without advanced programming, specialized control hardware, or software installation.

What's New: Streamlined Landing Page

A redesigned landing page centralizes key functions:

- Drag and drop new sources or rearrange existing content on single displays and video walls
- Create and launch presets for rapid configuration changes

Tablet or PC Compatibility

No software installation is required; the *Zio* GUI runs in any modern web browser on most PCs or tablets, providing touch-enabled access for operators and administrators.

Centralized System Management

Efficiently manage your *Zio* deployment from one location:

- Automatic discovery of *Zio* devices on the network
- Simultaneous firmware upgrades across multiple units
- Individual device configuration for optimal performance

Flexible AV Control

With the touch of a finger distribute and display AV content locally, across a campus, or even globally over IP. The Zio GUI ensures the right content appears in the right place at the right time.

Intuitive Operation

A streamlined drag-and-drop workspace lets operators quickly build, modify, and manage display layouts and signal routing. Live thumbnail previews of baseband and Zio IP sources provide immediate visual feedback, while user-defined presets simplify recurring configurations and workflows.

Specifications	
OS Support	Windows, MacOS, Linus, iPadOS, Android
Minimum display resolution	1366x768
